RESEARCH FOCUS

My group is a leader in the creation of materials for use in advanced membrane, sorbent and barrier applications. The underlying theme in all of these topics is the understanding and control of thermodynamic partitioning and molecular movement processes. Polymers are generally a

feature in all of the work in my group; however, the detailed materials can vary greatly depending upon the ultimate use that is desired. Highly glassy materials and hybrid inorganic-polymer materials are often topics we consider, since they offer diverse properties that can be engineered. Moreover pyrolysis of selected polymers to form glassy carbons is increasingly important in our studies due to the combination of molecular sieving and ease of processing they offer. For barriers, sheets are most commonly studied; however for membranes and sorbents, fibers are popular in our group. For membranes and sorbents, control of nanoscopic morphology in the fiber wall is critically important and is a special focus of our group.
